Taming Concept

Overview

The taming concept is similar to ARK, where it takes hours and players need to guard the tame or prevent other Monsters from attacking it while also maintain cage strength.
Enable players to tame and utilize a variety of creatures in the game.
Enhance gameplay diversity, provide companionship, and introduce strategic elements.
Rewarding players creative for cage building and taming

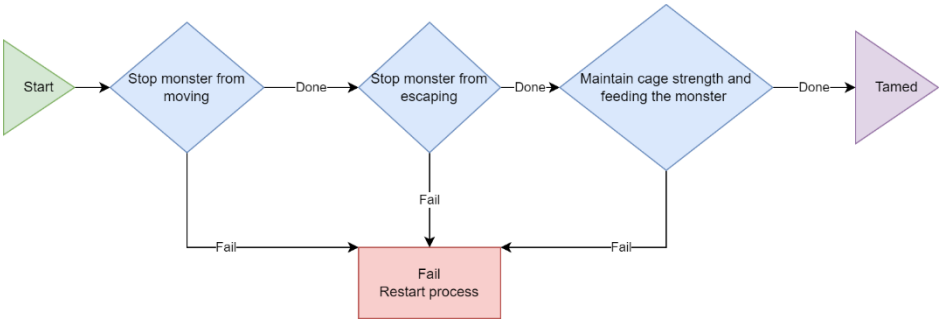

Creature Variety

Creature type will change the strategy of how the player can tame the monster, mostly through monster behavior

Unique Abilities: Creatures possess distinct abilities, enhancing player strategy.
Rarity Levels: Common, Rare, Legendary: Higher rarity creatures may require more advanced taming techniques.

Step-by-Step Guide

Even though monster type will affect the monster's behavior and the gameplay loop of how a player can tame the monster, the basic logic step of how the player can tame a monster is the same

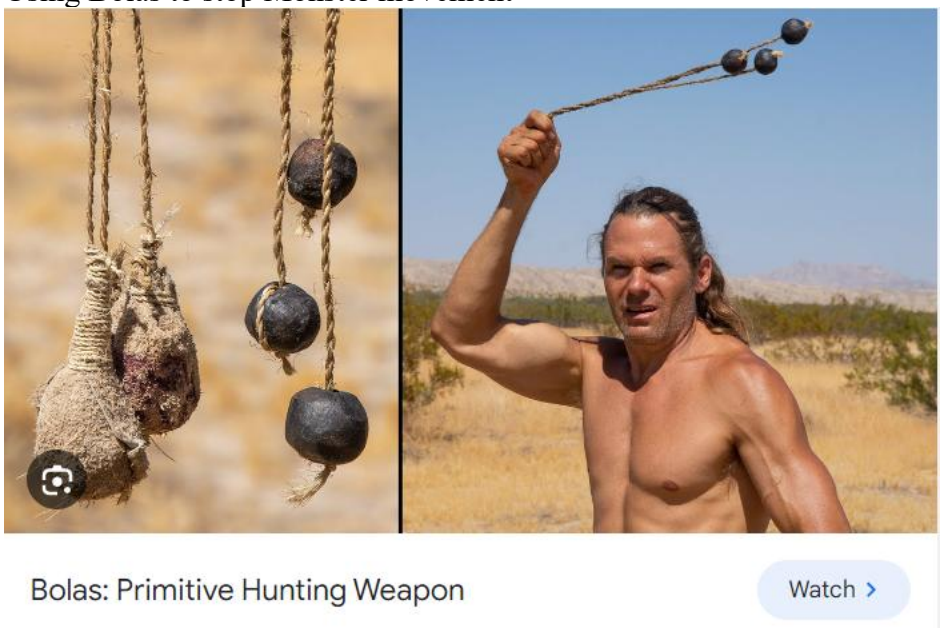

Step 1: Stop the Monster movement

The first step in taming involves capturing and immobilizing the monster. There are a few ways players can accomplish this:

1. **Using Traps**:

- The player needs to weaken the monster by lowering its health. This makes it less powerful and easier to manage.
- Once the health is lowered, the player can set a trap.
- The player must then lure the monster into the trap to immobilize it.
- Players should learn about each monster's elemental properties for effective trapping.
- **Trap note:**
  - Players need to employ traps that are effective against the monster's elemental type.
  - The effectiveness of a trap depends on its elemental property with the monster's elemental type. Elemental traps work best when they counter the monster's element. For example, a water-based trap is more effective against a fire-type monster.
  - The player sets the trap and lures the monster into it to immobilize it.
  - The trap will not affect the player's character.
- 

2. **Using Blunt Weapons or Knockout Effects**:
   - Alternatively, players can use weapons with blunt force or knockout effects.
   - Striking the monster with these weapons can render it unconscious for easier trapping.
3. **Using tools**
   - Using Spear/Arrow with a rope tide to the end, player can stop monster movement for a periods of time

- 
- Using Bolas to stop Monster movement
- 

Step 2: Stop the Monster from escaping

Once the monster is incapacitated, the next step is to secure it within a cage or fence.

1. **Small Monsters**:
   - Prefabricated cages are used for smaller monsters.
   - These cages are placed over the monster to contain it immediately.
2. **Large Monsters**:
   - For larger monsters, a fence is built piece by piece.
   - The enclosure is complete when all pieces are connected.

- 

Step 3: Taming the Monster through Feeding and Maintenance the cage

1. **Taming the Monster**
   - Players have two ways to tame a monster:
     - **Feeding the Monster**
       - Players must feed the monster the appropriate type of food.
       - A taming bar fills as the monster is fed. When full, the monster will change to an idle state, awaiting the completion step of taming
       - The taming bar fill rate will depend on monster size and level. So the higher level monster will take longer to tame
       - 
     - **Ride the monster**
       - For certain monster, player can attempt to mount the monster for certain time, if successful, the monster will be tamed
       - When attempting to ride, player stamina will be depleted at a rate depending on the monster and monster level
       - For big monster, player need to get close to the back of the monster to attempt to mount (standing near it is not enough)

- When get close to mounting point, a prompt to press "F" to start the mounting attempt will appear
- 

2. **Cage Maintenance**
    - Upon being trapped, monsters display an angry animation and attack the cage every 2 seconds.
    - Players use a hammer to repair the cage, maintaining its durability.
    - Different cages have varying durability levels. Higher-level cages are sturdier but require attention to prevent the monster from escaping.
3. **Completion of Taming**
    - The player approaches the passive monster and presses 'F' to initiate the final interaction.
    - This triggers a petting animation with particle effects. A naming window then allows the player to name the monster.
    - Upon naming, a burst of light and heart particles signify the successful taming of the monster.

Additional Notes:

-
    - Taming effectiveness varies based on the monster's size, type, and elemental attributes.
    - The final taming stage is visually engaging, emphasizing the player’s achievement and the newly formed bond with the monster.
    - Successfully tamed monsters can be used for various in-game activities, enhancing the overall gameplay experience.

Taming Tools and Items

- **Taming Equipment**

    - **Bolas, Tranquilizer Arrows, Elemental traps, Net**: Useful for immobilizing creatures.
    - **Taming Pen**: Enclosed structures that provide safety and containment during the taming process.
- **Specialized Foods**
    - **Herbivore Feed, Carnivore Feed**: Specific food items tailored to different types of creatures, enhancing the taming effectiveness.

Taming Challenges

- **Environmental Challenges**
    - **Predator Interference**: The presence of other creatures that may disrupt or attack during the taming process.
- **Player Strategy**
    - **Risk and Reward**: Players must assess the risks and benefits of attempting to tame certain creatures.
    - **Team Taming**: Cooperative strategies can be employed for taming larger or more dangerous creatures, or simply to reduce the amount of resource player need to prepare before taming, emphasizing teamwork and planning.

Optional

- **Weather Effects**: Various weather conditions can impact the effectiveness of the taming process.
- **Kibble System**: A more advanced feeding option offering higher quality food for faster and more efficient taming.

Risk

- **Technical Challenges**
    - **Weather Effects**: Various weather conditions can impact the effectiveness of the taming process.
    - **Elemental traps**: Each elemental will have difference behaviors depending on the monster elemental.
    - **<Traps> status effect:** Need a way to know if the monster is trap yet to then start the being tamed behaviors of the monster. This is for the case when players lure the monster into a cage (by using food item), the monster is not in the attacking state yet so it will not attacking the cage
- **Balancing**
    - Each monster will have it own type and elemental, which need to scale with it level, players levels need to reflex the player abilities to tame higher level monster
